Lab Goal

Before we get started building and debugging outbound REST API integrations we need to get our lab instance setup. In this lab you will be modifying an existing scoped application. Start out by importing the **CCW3970** application from Source Control. Follow the directions below to fork this application to your GitHub account and begin working.

Lab Setup

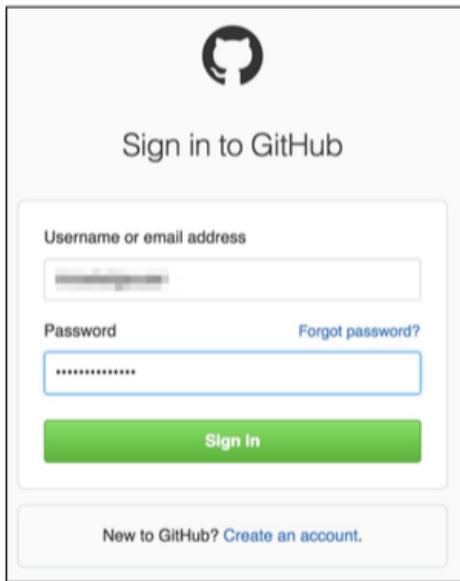

Prerequisites

In order to complete this lab, you must:

1. Create a GitHub account if you do not already have one.
2. Install Postman from <https://getpostman.com> if you do not already have it installed.

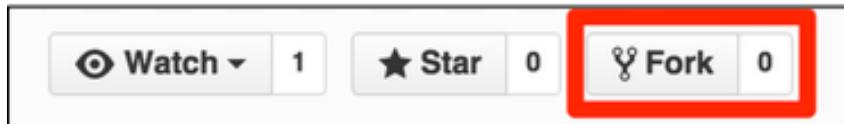

Fork the Lab GitHub Repository

3. Log in to your GitHub account at:
<https://github.com/login>

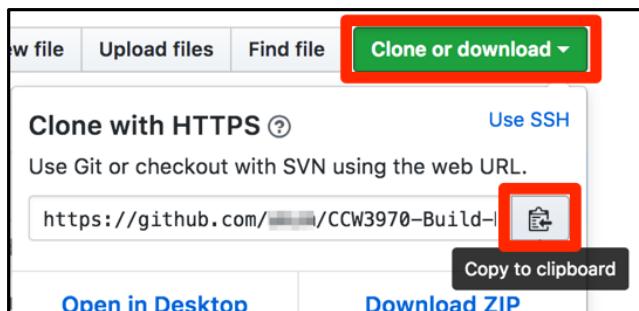

4. Navigate to:
<https://github.com/CreatorCon17/CCW3970-Build-Debug-Outbound-REST-App>

5. Click **Fork**. To fork the repository.

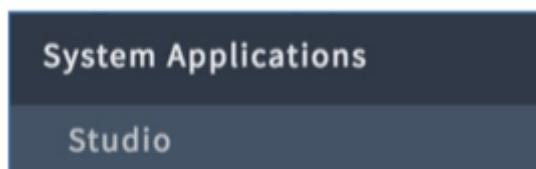

6. Note in the upper left that the repository has been copied to your account. You now have a copy of the lab material for reference after the conference!
7. Click on Clone or download button and locate the HTTPS field then click the clipboard to the right. This action copies the URL in the clipboard.

IMPORTANT: Be sure to copy the **HTTPS** repo URL in GitHub.

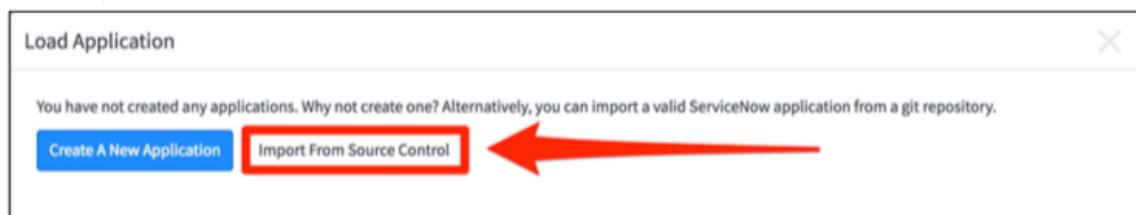

Import the CCW3970 Application from Source Control

8. Log in to your lab instance with the **admin** credentials provided on the cover sheet of this document.
9. Navigate to **System Applications > Studio**.

10. Click on **Studio**.
11. Click **Import from Source Control**.

12. In the Import Application window, paste the URL copied in step 5 and provide your GitHub credentials. Click **Import**.

The dialog box has a title bar "Import Application" and a message area: "Importing an application from source control will result in a new application being created in this ServiceNow instance based on the remote repository you specify. The account credentials you supply must have read access to the remote repository. The remote repository you specify must contain a valid ServiceNow application. For more information on requirements refer to ServiceNow product documentation." It contains three input fields: "URL" with the value "https://github.com/CreatorCon17/CCW3970-Build-Debug-Outbound-REST-App.git", "User name" with a placeholder " |", and "Password". At the bottom are "Cancel" and "Import" buttons.

13. When the import completes, click **Select Application**.

The dialog box has a title bar "Import Application" and a message area: "Success" with a green checkmark icon. Below it says "Successfully applied commit f46f7019e8090de045f9511f87eef8328927a1e6 from source control". At the bottom is a "Select Application" button.

14. Click on the **CCW3970** application you just imported to load this application into Studio.

The dialog box has a title bar "Load Application" and two buttons: "Create Application" and "Import From Source Control". Below is a section titled "Applications (4)" with a search bar "Filter...". A table lists four applications:

Status	Application	Vendor	Version	Created on	Updated On ↓
↑	<u>CCW3970</u>		1.0.0	2017-04-17	2017-04-17 20:47:18
↑	My Work		2.0.0	2016-03-14	2016-03-14 12:01:04
↑	SND Xplore		4.1	2016-09-30	2016-09-30 02:31:36
↑	Demo API		3.0	2015-12-11	2015-12-11 07:23:12

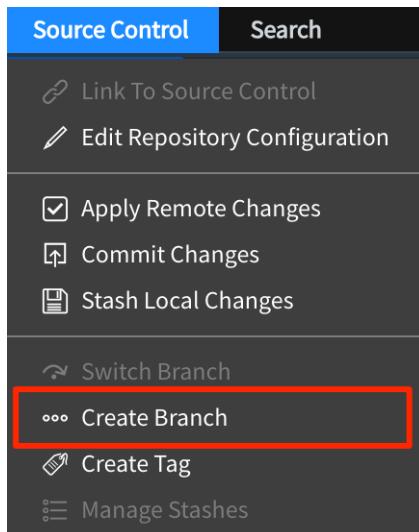

You've now successfully imported your forked version of the application for use in this workshop.

Get ready for Lab 2 – Create a new branch from Lab2-start tag in Studio

1. Yes, you read that correctly, we won't be using ServiceNow again until Lab2, but we want to get you ready ahead of time.

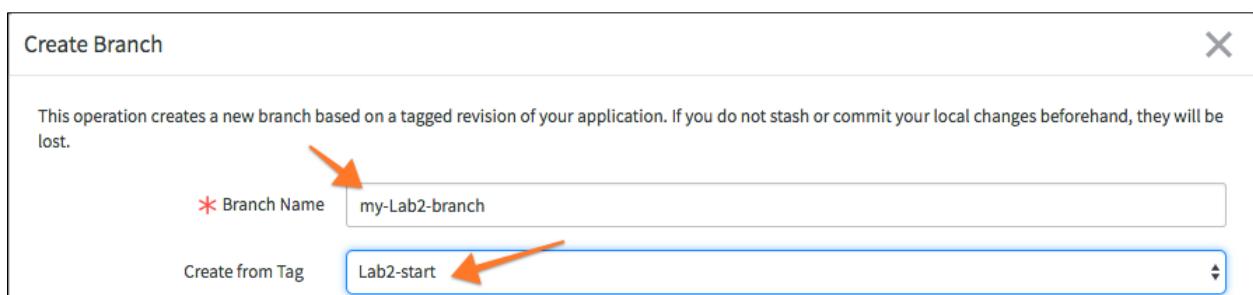

NOTE: This is worth mentioning, not a typo, you are importing and opening this application in Studio but we will not be using ServiceNow again until you start **Lab**

2. In Studio, navigate to Source Control > Create Branch.

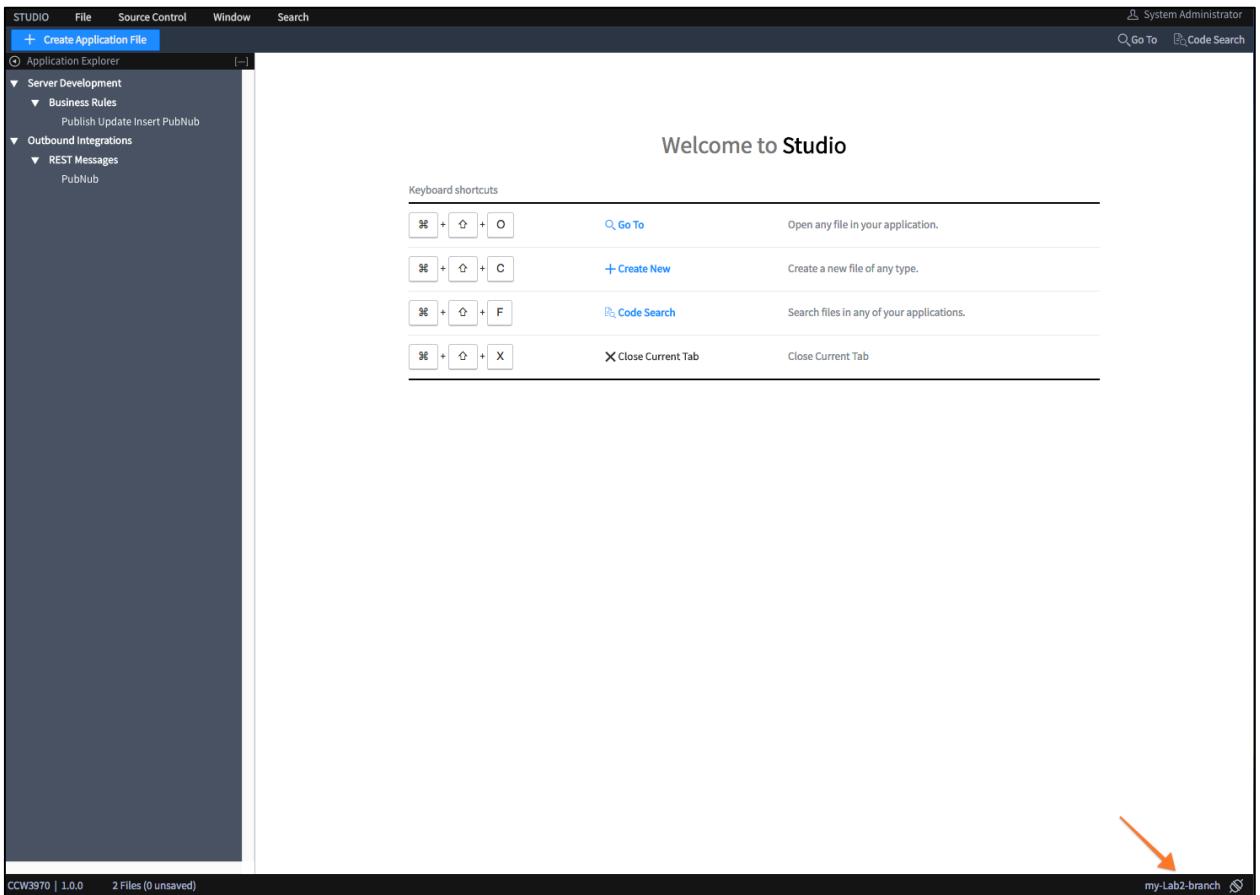

3. In the pop-up window, enter a branch name, then select **Lab2-start** from the Create from Tag menu, and click Create Branch.

Branch: **my-Lab2-branch**
Create from Tag: **Lab2-start**

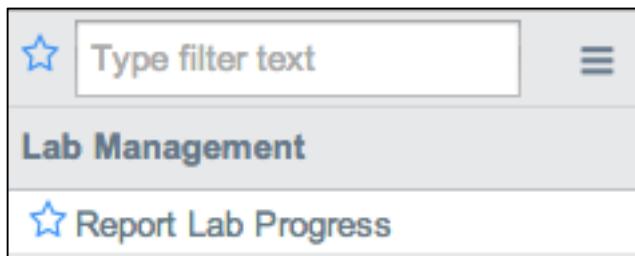

4. When the switch is complete, click **Close Dialog** in the Create Branch pop-up.
5. Verify Studio is on branch **my-Lab2-branch** (bottom right hand corner).

6. Lab setup is complete. You are now ready to start **Lab 1**.

Progress Report

1. Navigate to **Lab Management> Report Lab Progress**.

2. Click I am done!

Let instructor know how you are doing on the lab(s) by selecting the appropriate button.

I am done!

Lab Goal

The purpose of this workshop is to familiarize yourself with ServiceNow Outbound Messaging capabilities available to you for building integrations with 3rd party REST APIs as well as how you can debug your integrations.

In this first **lab** you'll familiarize yourself with the **PubNub** 3rd party REST API we'll be working with for the rest of this workshop and use **Postman** (an API testing tool) to build requests you can execute and review from your localhost.

Lab 1
Publish
Message
with
Postman
“Hello

Prerequisites

- Knowledge of REST APIs
- Knowledge of HTTP clients
- Postman API testing tool installed. If you still need to install the Postman go to:
<https://www.getpostman.com/>

Check out PubNub

When building an integration between cloud based service providers it's a good idea to start out by mocking up your requests with a tool that you can run on your localhost such as [cURL](#), [Postman](#) or [Paw](#). Each of these tools allow you to build and execute HTTP requests from your localhost (laptop, desktop, etc....). This enables you to build and execute your requests in a very agile way and also provides you with a working example to reference when you start building your integration in ServiceNow.

In this lab we'll be working with [PubNub](#), PubNub is a 3rd party streaming data service. You'll start getting familiar with the API by using Postman to make a request to the Publish Message operation of the PubNub REST API. This operation allows you to publish messages via HTTP.

PubNub offers a rich set of functionality but for the purposes of this workshop we'll only be using their Publish Message capabilities. If you are interested in finding out more about PubNub and PubSub services you should check out their website and API docs.

Start out by briefly review the API for PubNub at:

<https://www.pubnub.com/docs/pubnub-rest-api-documentation#publish-subscribe-publish-v1-via-post-post>

Specifically look at the Publish via POST operation.

The screenshot shows the PubNub REST API Documentation page. On the left, there's a sidebar with various navigation links like Overview, Common REST Query String Parameters, Common HTTP Request Headers, Common HTTP Status Codes, Publish / Subscribe (with options for GET and POST), Channel Groups, PubNub Access Manager - PAM, and Presence. The main content area is titled "PubNub REST API Documentation" and shows the "Publish via POST" operation. It includes the POST method, the endpoint "/publish/{pub_key}/{sub_key}/0/{channel}/{callback}?store,uuid", and a note "Publish JSON to channel via POST". Below this, there's a "URI Parameters" section with detailed descriptions for each parameter: pub_key (string required), sub_key (string required), channel (string required), callback (string required), store (number optional), auth (string optional), meta (object optional), and uuid (string required). There are also sections for "Request without JSONP" (Headers: Content-Type: application/json, Location: /publish/myPubKey/mySubKey/ch1/0) and "Body" (containing a JSON message: {"message": "All your base are belong to us."}). On the right side of the main content area, there are social sharing icons for Facebook, Twitter, Google+, LinkedIn, and a "Feedback" button.

You'll be using the Postman to make a request to the PubNub REST API and publish a message to a channel. The PubNub REST API provides an endpoint that accepts a POST request to publish a message onto a channel that other clients can subscribe to. Per the documentation this method requires the parameters **pub_key**, **sub_key**, and **channel** be specified as URL path parameters and a **uuid** be provided as a query parameter.

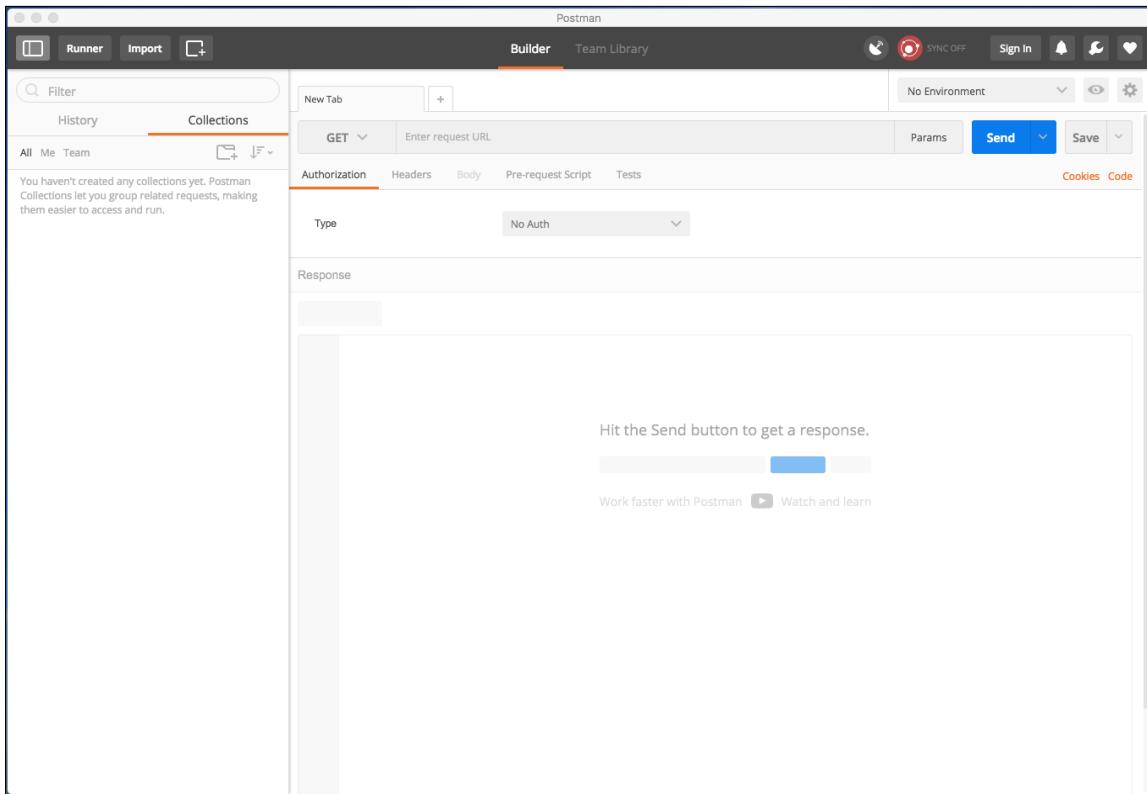

Example URI

POST https://pubsub.pubnub.com/publish/{pub_key}/{sub_key}/0/{channel}/0?store=1&uuid={client}

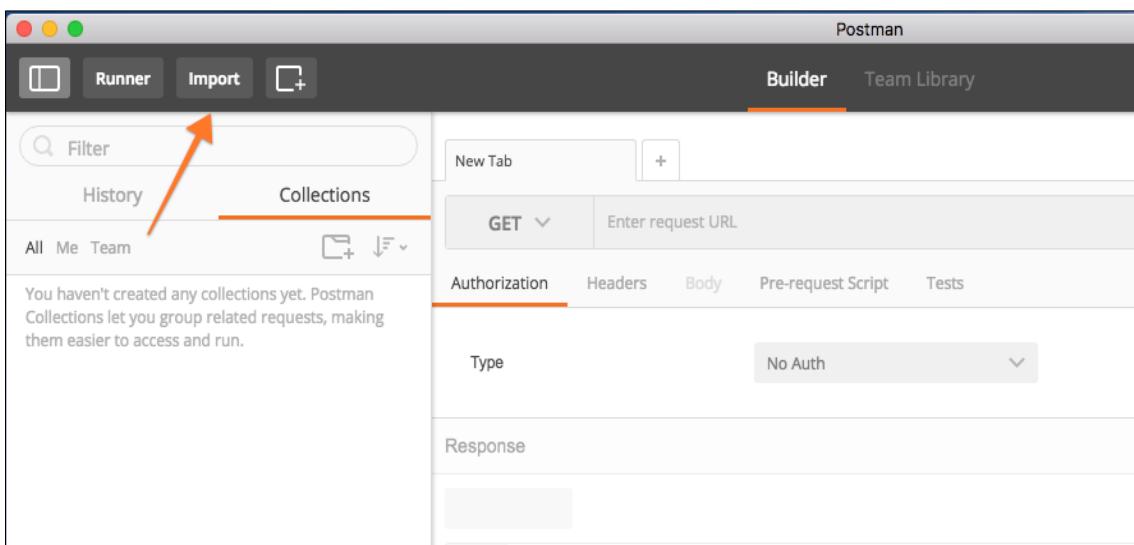

Build and Send a Request to Publish with Postman

Let's begin by building a request to publish a message to PubNub in Postman. We've built and made a prebuilt Postman collection to help you get started.

1. Open the Postman application on your laptop.

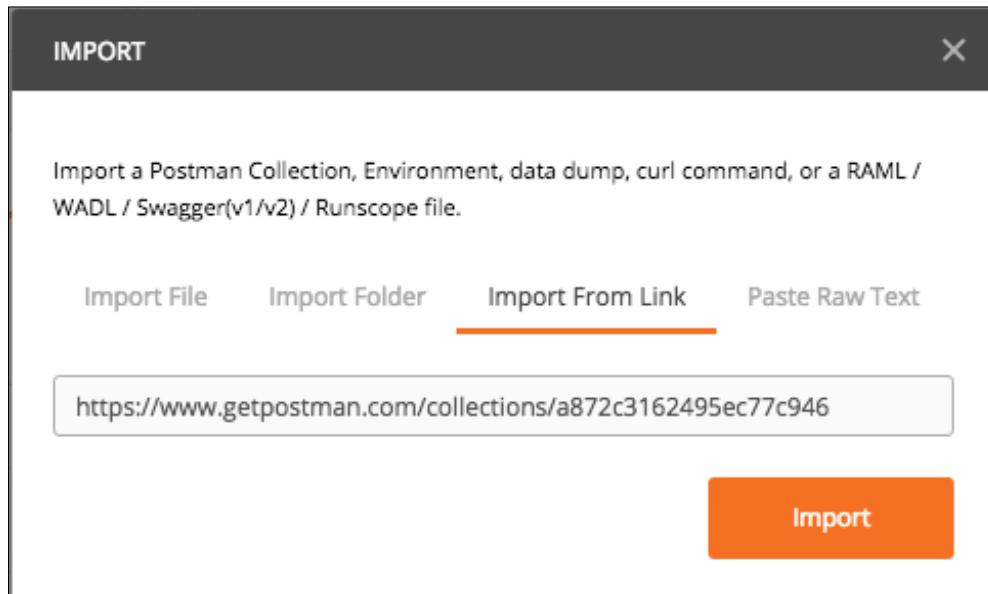

2. Import the Postman collection we will be using for this workshop. In Postman, click **Import**.

3. Postman Collection Link:

<https://www.getpostman.com/collections/25a87e008d055aec5496>

Paste the link to our Postman collection in the **Import From Link** input box.

- Verify you have the **CCW3970-PubNub** collection loaded by searching for it in the navigator on the left hand side.

The screenshot shows the Postman application interface. On the left, the 'Collections' section lists 'CCW3970-PubNub' with '1 request'. The main area displays a POST request titled 'Publish To Channel' with the URL [https://pubsub.pubnub.com/publish/{pub_key}/{sub_key}/0/{channel}/0?store=1&uuid=\[client\]...](https://pubsub.pubnub.com/publish/{pub_key}/{sub_key}/0/{channel}/0?store=1&uuid=[client]...). The 'Headers' tab shows a Content-Type header set to 'application/json'. Five orange arrows point from the numbered steps below to specific elements: Step 1 points to the 'Collection' icon in the sidebar; Step 2 points to the 'Collection' name 'CCW3970-PubNub'; Step 3 points to the 'Request Title' 'Publish To Channel'; Step 4 points to the 'URL' field; and Step 5 points to the 'Content-Type' header key.

PubNub Keys:

pub_key: pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8

sub_key: sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe

- In the **CCW3970-PubNub** collection select the **Publish To Channel** operation.
 - Replace the `{pub_key}` parameter with the `pub_key` provided in this lab doc.
 - Replace the `{sub_key}` parameter with the `sub_key` provided in this lab doc.
 - Replace the `{client}` parameter with your lab instance name (e.g., if your lab instance is `lab1.service-now.com`, replace the `{client}` param as '`lab1`'.
 - Replace the `{channel}` parameter with "`CCW3970_{instance-name}`" where `{instance-name}` is the name of your lab instance (e.g., `CCW3970_lab1`).

Example:

https://pubsub.pubnub.com/publish/pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8/sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe/0/CCW3970_lab1/0?store=1&lab1

- Verify the headers specify 'Content-Type: application/json'.
- Verify the body includes the following as JSON.

```
{"message": "Hello PubNub from ServiceNow CCW3970 Lab Instance"}
```

The screenshot shows the Postman interface with a collection named "Publish To Channel". The request is a POST to https://pubsub.pubnub.com/publish/{pub_key}/{sub_key}/0/{channel}/0?store=1&uuid={client}. The "Body" tab is selected, showing a JSON payload:

```
1 [ {  
2   "message": "Hello PubNub from ServiceNow CCW3970 Lab Instance"  
3 } ]
```

g. Click **Send** to send the HTTP Request.

The screenshot shows the same Postman interface as before, but with an orange arrow pointing to the "Send" button in the top right corner of the request panel.

6. Verify the request was successful by looking for the **200 OK** status code and that the response payload contains “sent” as shown.

The screenshot shows the Postman interface with a successful API call to `https://pubsub.pubnub.com/publish/pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8/sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe/0/CCW3970_...`. The request method is POST, and the body is JSON with the message: `{"message": "Hello PubNub from ServiceNow CCW3970 Lab Instance"}`. The response status is 200 OK, and the response body is `[1, "Sent", "14925822833898580"]`.

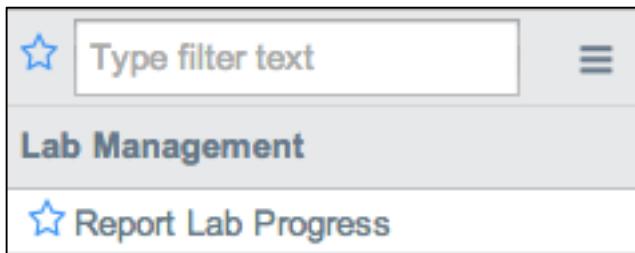

If you see **200 OK** you've now successfully published a message to PubNub using Postman from your local host. If you had errors check your URI and parameters or ask a Lab Guru for assistance.

This is an important step in building an integration because using a tool like Postman allows you to quickly familiarize yourself with a 3rd party API so that when you build your integration in ServiceNow you know that you've had a working request, understand how to format your request to send successfully and can refer back to this when building and testing your request in ServiceNow. In addition, it is becoming common for REST API providers to provide either cURL or Postman samples for consuming their APIs which can speed this process along.

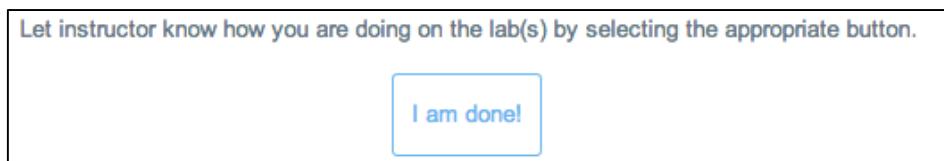

In the next lab you'll use ServiceNow to issue HTTP requests to PubNub to publish messages from ServiceNow similar to how you used Postman in this lab.

Progress Report

1. Navigate to **Lab Management> Report Lab Progress.**

2. Click I am done!

Lab Goal

In the first **lab** you used Postman to publish messages to PubNub using their REST API. In this **lab** you'll use the ServiceNow RESTMessage capabilities to publish messages to PubNub. You'll start by configuring a RESTMessage record and testing your configuration using scripts background. Next you'll use business rules to trigger messages publishing to PubNub when Incident records are mutated. In addition, you'll use the outbound http request logs in ServiceNow to debug your requests.

Lab 2 Publish Message with ServiceNow

Create Lab 2 starting branch

1. If you completed the lab setup, proceed to the next step. If you haven't yet completed lab setup, follow the steps in lab setup to create the **my-Lab2-branch** from the **Lab2-start** git tag.

Configure and Test with RESTMessage

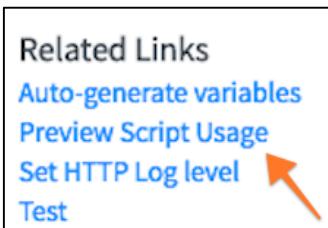

1. In your ServiceNow lab instance navigate to **System Web Services -> REST Message**
2. Navigate to PubNub-> **Publish Message**. This message has been partially configured to send messages to the same PubNub REST API operation we sent a request in Postman. Note the variables we've specified in the **Endpoint** field and the **Variable Substitutions** that exist in the related list at the bottom. This will allow us to easily specify these variables as parameters when using this RESTMessage HTTP Method from script.
3. Verify method is **POST**.

The screenshot shows the configuration of an HTTP Method named "Publish Message". The "HTTP method" is set to "POST" and the "Endpoint" is `https://pubsub.pubnub.com/publish/${pub_key}/${sub_key}/0?store=1&${client}`. The "Variable Substitutions" table lists four variables: `channel`, `client`, `pub_key`, and `sub_key`, all with "No escaping" as the escape type.

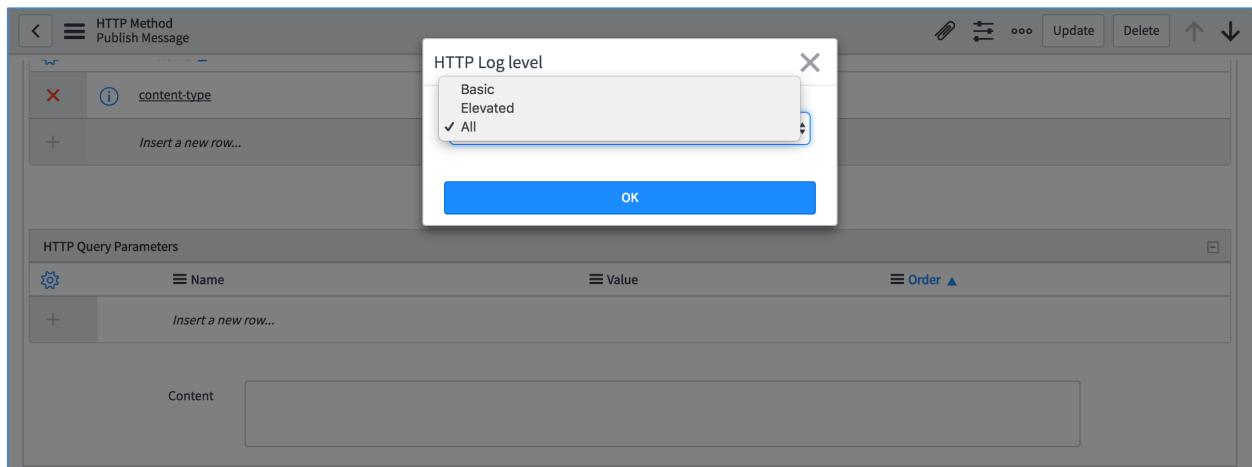

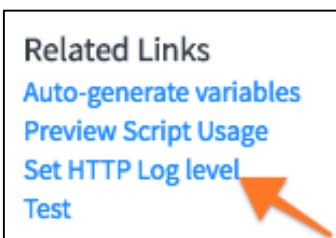

4. Populate Header “Content-Type” : “application/json”

The screenshot shows the configuration of an HTTP Request. In the "HTTP Headers" section, there is a row for "content-type" with the value "application/json".

5. Click **Preview Script Usage** in the list of Related Links, and you'll see auto generated sample script that can be used to execute this request from anywhere in ServiceNow where you can use Server Side script (e.g., Business Rules, Workflows, Script Actions).

6. Now set the **HTTP Log level** for this record to **All**. This allows you to control what level of detail is logged when outbound messages are sent from ServiceNow.
7. **Note:** For more information about what is included in each log level see [Outbound HTTP Logging](#) in the ServiceNow docs. No additional info about logging levels is necessary for this lab.

PubNub Keys:

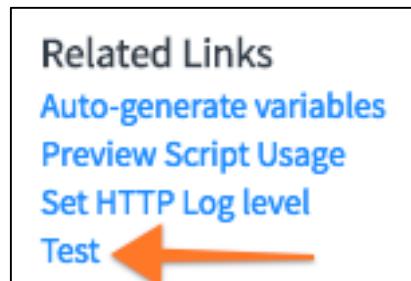

pub_key: pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8
sub_key: sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe

8. Populate Test Variables in **Variable Substitution** for:
 - a. **pub_key**, specify pub_key provided in this lab guide
 - b. **sub_key**, specify sub_key provided in this lab guide
 - c. **client**, specify your lab instance name

- d. **channel**, specify “CCW3970_{you lab instance name} (e.g, if your instance name iscc17d-brb-332-001, for the channel you would specify “CCW3970_cc17d-brb-332-001”.

Variable Substitutions (4) Test Runs (3)		
	Name	Escape type
	channel	No escaping
	client	No escaping
	pub_key	No escaping
	sub_key	No escaping

9. Click **Test**

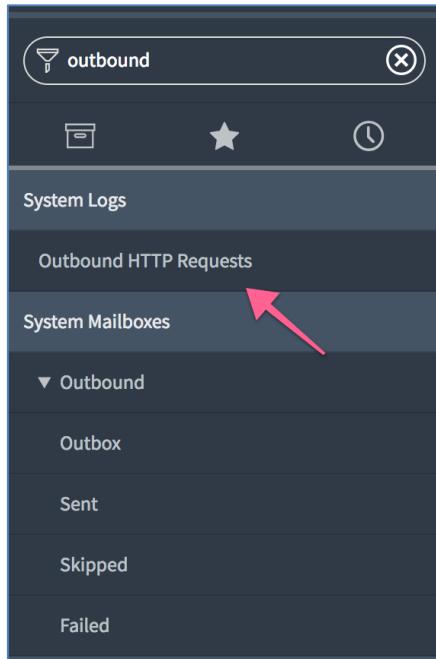

10. Verify the request fails with HTTP status **404**, (this is expected).

Test Runs	
Created 2017-04-19 13:39:41	
Name	Publish Message
HTTP status	404
Endpoint	https://pubsub.pubnub.com/publish/pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8/sub-c-dafe9b8c-iae1-11e7-bc52-02ee2ddab7fe/0/CCW3970_cc17d-brb-332-001/?store=1&cc17d-brb-332-001
Parameters	store=1&cc17d-brb-332-001
Content	
Response	

11. Now let's figure out why. Go to the system logs to get a better idea of the request we sent and the response we received from PubPub. This will allow us to compare the request sent from ServiceNow with the successful request we sent from Postman and determine what we need to change.

12. Navigate to System Logs -> Outbound HTTP Requests.

13. Review the list of recent outbound http requests.

Outbound HTTP Logs					
	Created	Sequence	URL hostname	Response status	Response time (ms)
<input type="checkbox"/>	2017-04-19 09:12:12	4	pubsub.pubnub.com	404	11
<input type="checkbox"/>	Actions on selected rows... ▾				

14. Find the last sent message and view the log contents including:

- Method
- URL
- Response Status
- Response Time
- Headers
- Body

The screenshot shows the 'Outbound HTTP Log' window from ServiceNow. The log entry is for a POST request to `https://pubsub.pubnub.com/publish/pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8/sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe/0/CCW3970_cc17d-brb-332-001?store=1&cc17d-brb-332-001`. The response status is 404, and the response time is 61 ms. The response body is empty. Orange arrows point to the 'POST' method, the '404' status, the URL, and the empty response body.

15. Compare the request sent from ServiceNow that **failed** with the successful request sent from Postman. What differs? Are there any messages in the response that indicate what the problem was? (Hint: look at the request body you sent from Postman and the one you sent from ServiceNow).

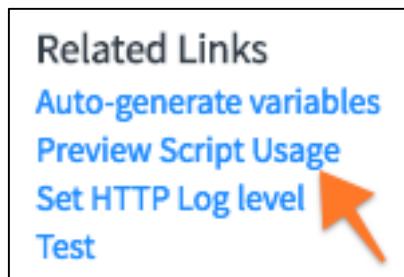

16. Go back to the **Publish Message** record in Studio and specify **content** of

```
{"message": "Hello PubNub from ServiceNow CCW3970 Lab Instance"}
```

17. Save the record and run another test and verify your HTTP status is now **200**.

Use RESTMessage from Script

1. Now let's use the usage script to make a request and include a request body. First grab the usage script at by clicking **Preview Script Usage**.

2. Review the **Preview REST Message script usage** from the RESTMessage Record. This provides you with an auto-generated script that you can use as a basis for script you use elsewhere (server side) to trigger this RESTMessage (e.g., business rule, script action, scripts

background).

The screenshot shows a browser window with the title "Preview REST Message script usage". The content area contains the following JavaScript code:

```
try {
    var r = new sn_ws.RESTMessageV2('x_snc_ccw3970.PubPub', 'Publish Message');
    r.setStringParameterNoEscape('sub_key', 'sub-c-dafe9b8c-1ae1-11e7-bc52-02ee');
    r.setStringParameterNoEscape('client', 'cc17d-brb-332-001');
    r.setStringParameterNoEscape('pub_key', 'pub-c-11b9ede6-f9ee-4da8-a829-944a');
    r.setStringParameterNoEscape('channel', 'CCW3970_cc17d-brb-332-001');

    //override authentication profile
    //authentication type ='basic'/ 'oauth2'
    //r.setAuthentication(authentication type, profile name);

    var response = r.execute();
    var responseBody = response.getBody();
    var httpStatus = response.getStatusCode();
}
catch(ex) {
    var message = ex.getMessage();
}
```

3. In a new browser tab navigate to the following link and copy the script. We've slightly modified the auto generated script from the RESTMessage record to add a message body.

[https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-
Outbound-REST-
Snippets/master/ccw3970_scripts_background_restmessage_hello_pubnub.js](https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-
Outbound-REST-
Snippets/master/ccw3970_scripts_background_restmessage_hello_pubnub.js)

4. Let's try it out now. Outside of **Studio** navigate to **System Definition -> Scripts – Background** and paste it into the script box (as shown below).

```

Run script (JavaScript executed on server)
/*
Advanced Business Rule Script to publish message to PubPub Service Using RESTMessageV2 API to issue HTTP Request
*/
(function executeBusinessRule() {
    try {
        var instanceName = gs.getProperty('instance_name');
        var instanceId = gs.getProperty('instance_id');
        var req = new sn_ws.RESTMessageV2('PubPub', 'Publish Message');
        req.setParameterNoEscape('pub_key', 'pub-c-11b9ed6-f9ee-4da8-a829-944a45f29eb8');
        req.setParameterNoEscape('client', instanceName + '-' + instanceId);
        req.setParameterNoEscape('sub_key', 'sub-c-dafe9b8c-1ae1-11e7-cc52-02ee2ddab7fe');
        req.setParameterNoEscape('channel', 'CCW3970-' + instanceName);

        var body = {'message': "Hello PubPub from CCW3970 Lab Instance " + instanceName + "'"};
        req.setRequestBody(body);
    }
    catch(ex) {
        var message = ex.getMessage();
        gs.debug(message);
    }
}
);

```

Run script in scope x_snc_ccw3970 Cancel after 4 hours

5. Send the request by clicking **Run Script**.
6. You should see a debug message indicating the response status code is **200** indicating a successful request. Let's look at the **Outbound HTTP Log** to see a bit more detail about the request and response.
7. Navigate to **System Logs -> Outbound HTTP Requests**.
8. Open the most recently sent message and review the sent request details. This allows you to see all the details of the sent request from ServiceNow to PubPub and the corresponding response. Having access to this level of detail is invaluable when trying to debug or verify communication between cloud based systems.
9. Let's also verify the message was received on PubPub. In a new browser tab navigate to <https://ccw3970-demo.glitch.me/>

Enter the channel name you specified when sending the request (e.g., CCW3970_cc17d-brb-332-001) and click **Subscribe**. This is a lightweight web application that can subscribe to the PubPub channels and will automatically update when messages are published to the channel it's subscribed to.

PubPub Channel Log

Specify a channel to see a list of messages published to it streamed live:

Subscribed to channel: **CCW3970_cc17d-brb-332-001**

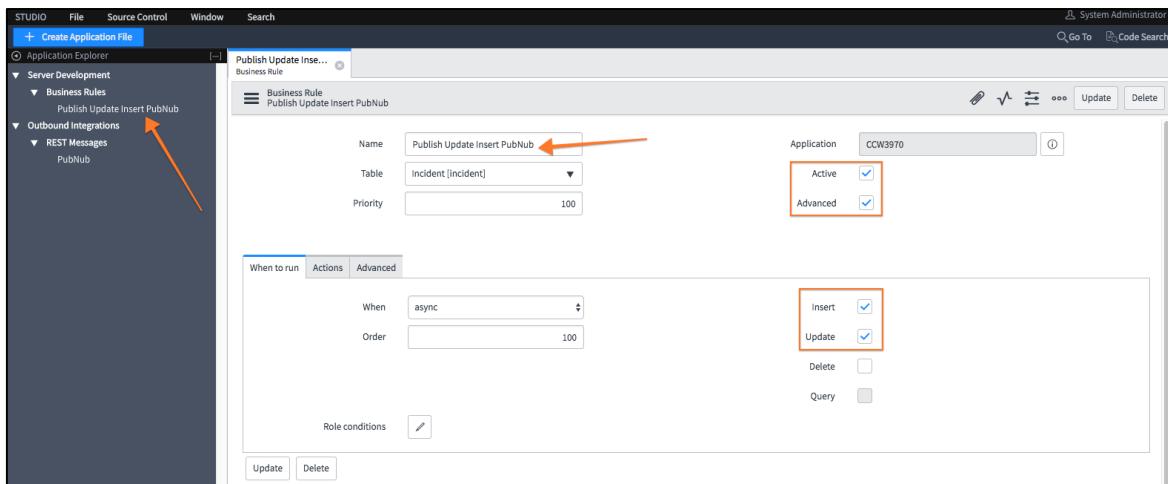

Live Messages ordered newest on top:

channel: CCW3970_cc17d-brb-332-001
timetoken: 14926349421604694
message:
{ "message": "Hello PubPub from ServiceNow CCW3970 Lab Instance"}

10. Issue another request using Scripts Background and then you should see your message show up in the PubNub Channel Log at <https://ccw3970-demo.glitch.me/> without needing to update (page will auto update when new messages are published).
11. Now that you've seen how you can publish a message (send a HTTP request) from a script let's put this to use and configure a business rule to publish messages to PubNub when an Incident is either inserted or updated in your lab instance.

Configure Business rule to Publish Messages to PubNub

1. In Studio open the **Publish Update Insert PubNub** business rule which is part of the **CCW3970** application.

2. Verify the business rule is configured to run on **insert** and **update**, **advanced** is checked and **when** is set to run **async**. You will be making changes to this business rule so that when it is triggered, on insert or update, of an Incident record a message will be published to PubNub.
3. In the business rule set the advanced script by copying and pasting values from.
https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-Outbound-REST-Snippets/master/ccw3970_advanced_business_rule_publish_updates_to_pubnub.js

The screenshot shows the 'Business Rule' configuration page. At the top, there are tabs for 'Name', 'Table', 'Priority', 'Application', 'Active', and 'Advanced'. Below these are three tabs: 'When to run', 'Actions', and 'Advanced'. The 'Advanced' tab is selected. In the 'Condition' section, there is a large text area labeled 'Script' which contains the following code:

```

1 v /*
2 Advanced Business Rule Script to publish message to PubPub Service Using RESTMessageV2 API to issue HTTP
3 Request
4 Publish message containing select subset of fields from the incident record that has been updated or
5 inserted
6 */
7 (function executeBusinessRule() {
8     try {
9         var instanceName = gs.getProperty('instance_name');
10        var req = new sn_ws.RESTMessageV2('PubPub', 'Publish Message');
11        req.setStringParameterNoEscape('pub_key', 'pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8');
12        req.setStringParameterNoEscape('client', instanceName);
13        req.setStringParameterNoEscape('sub_key', 'sub-c-dafe9bc-1e1-11e7-bc52-02ee2ddab7fe');
14        req.setStringParameterNoEscape('channel', 'CCW3970_' + instanceName);
15
16        // Build a data transfer object representing the incident record to be sent as JSON to PubPub
17        var DTOIncident = {
18            'assigned_to': current.getDisplayValue('assigned_to'),
19            'category': current.getValue('category'),
20            'created_on': current.getValue('sys_created_on'),
21            'number': current.getValue('number'),
22            'priority': current.getDisplayValue('priority'),
23            'state': current.getDisplayValue('state'),
24            'sys_id': current.getValue('sys_id'),
25            'updated_by': current.getValue('sys_updated_by'),
26            'updated_on': current.getValue('sys_updated_on'),
27            'caller_id': current.getDisplayValue('caller_id')
28        }
29
30        req.setObjectParameter('body', DTOIncident);
31
32        req.execute();
33    }
34 }

```

- Save the record and review this **Script**. Note we are still using the RESTMessage record but now we are populating the body with values from the inserted or updated Incident.

```

1  /*
2   Advanced Business Rule Script to publish message to PubNub Service Using RESTMessageV2 API to issue HTTP Request
3   Publish message containing select subset of fields from the incident record that has been updated or inserted
4   */
5  (function executeBusinessRule() {
6    try {
7      var instanceName = gs.getProperty('instance_name');
8      var req = new sn_ws.RESTMessageV2('PubNub', 'Publish Message');
9      req.setStringParameterNoEscape('pub_key', 'pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8');
10     req.setStringParameterNoEscape('client', instanceName);
11     req.setStringParameterNoEscape('sub_key', 'sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe');
12     req.setStringParameterNoEscape('channel', 'CCW3970_.' + instanceName);
13
14     // Build a data transfer object representing the incident record to be sent as JSON to PubNub
15     var DTOIncident = {
16       'assigned_to': current.getDisplayValue('assigned_to'),
17       'category': current.getValue('category'),
18       'created_on': current.getValue('sys_created_on'),
19       'number': current.getValue('number'),
20       'priority': current.getDisplayValue('priority'),
21       'state': current.getDisplayValue('state'),
22       'sys_id': current.getValue('sys_id'),
23       'updated_by': current.getValue('sys_updated_by'),
24       'updated_on': current.getValue('sys_updated_on'),
25       'caller_id': current.getDisplayValue('caller_id'),
26       'active': current.getValue('active')
27     };
28
29     // Convert DTO to JSON string
30     var body = JSON.stringify(DTOIncident);
31     req.setRequestBody(body);
32
33     // Execute request
34     var res = req.execute();
35     var responseBody = res.getBody();
36     var httpStatus = res.getStatusCode();
37     gs.debug(httpStatus);
38   }
39
40   catch (ex) {
41     var message = ex.getMessage();
42     gs.debug(message);
43   }
44 })();

```

Build request

Build data transfer object from Incident

Convert to JSON string

Publish message

5. The **business rule** is now configured to publish the JSON (data transfer object) representation of the Incident to PubNub whenever an Incident record is created or updated.
6. **Try it out**, update an Incident Record. Change the **Caller** to **David Loo**. Save the incident record and be sure to note the Incident Number.
7. Go to the Outbound HTTP Logs and verify that a request with a payload including this Incident number was sent to PubNub and that the response status was **200**.
8. Verify on PubNub that the message was received. If you still have your other browser tab open to <https://ccw3970-demo.glitch.me/> then you should see a new message has been added to the top of the log. If you closed your browser tab then you'll need to reopen it and subscribe to the appropriate channel. **Note:** The channel name should be "CCW3970_{your lab instance_name}". You can always go back to your advanced business rule script and find it as well. **Channel names are case sensitive.**
9. In my example shown below, I updated **INC20001**, setting the caller to **David Loo**. My instance name was **bbarnsc1** and the corresponding channel name that I subscribed to was **CCW3970_bbarnsc1**. You should see something similar.

PubNub Channel Log

Specify a channel to see a list of messages published to it streamed live:

Subscribed to channel: **CCW3970_bbarnsc1**

Live Messages ordered newest on top:

```
channel: CCW3970_bbarnsc1
timetoken: 14926372053231464
message:
{"assigned_to":"David Loo","category":"hardware","created_on":"2009-09-10 02:25:40","number":"INC20001","priority":"3 - Moderate","state":"Resolved","sys_id":"a1c35b5e0a0a0b6400afb27a259556a3","updated_by":"admin","updated_on":"2017-04-19 21:26:41","caller_id":"David Loo","active":1}

channel: CCW3970_bbarnsc1
timetoken: 14926371957634739
message:
{"assigned_to":"David Loo","category":"hardware","created_on":"2009-09-10 02:25:40","number":"INC20001","priority":"3 - Moderate","state":"Resolved","sys_id":"a1c35b5e0a0a0b6400afb27a259556a3","updated_by":"admin","updated_on":"2017-04-19 21:26:31","caller_id":"Sam Sorokin","active":1}

channel: CCW3970_bbarnsc1
timetoken: 14926371858632028
message:
{"assigned_to":"David Loo","category":"hardware","created_on":"2009-09-10 02:25:40","number":"INC20001","priority":"3 - Moderate","state":"Resolved","sys_id":"a1c35b5e0a0a0b6400afb27a259556a3","updated_by":"admin","updated_on":"2017-04-19 21:26:23","caller_id":"David Loo","active":1}
```

If you see your messages great! You've successfully completed this lab and you've now configured your ServiceNow instance to publish messages to PubNub using Business Rules, and the RESTMessageV2 API when Incidents are created or updated in your lab instance.

If You don't see these messages in the outbound HTTP log or in the PubNub Channel Log then review your script for variances or ask a lab guru for help.

In the next lab we'll see how we can do this using ServiceNow Workflow and Orchestration.

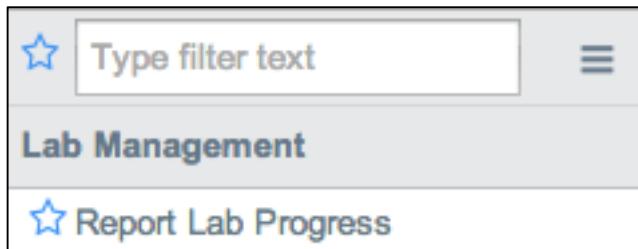

Catch Up

1. If you had problems with this lab and want to fast forward to the end of lab 2 to review the completed updates you can follow the same process, you followed in **Lab Setup** to create a branch from the **Lab2-end tag**. This will update your application to a state that you would be if you successfully completed Lab2.
2. In Studio, navigate to **Source Control > Create Branch**.
3. In the pop-up window, enter a branch name, then select **Lab2-end** from the **Create from Tag** menu, and click **Create Branch**.

Branch: **my-Lab2-end-branch**
Create from Tag: **Lab2-end**

Progress Report

1. Navigate to **Lab Management> Report Lab Progress.**

2. Click I am done!

Let instructor know how you are doing on the lab(s) by selecting the appropriate button.

Lab 3 Use Orchestration

Lab Goal

Now we're going to implement the same use case as the previous lab, but using Orchestration and Workflow. Orchestration is a powerful tool for building low-code and no-code integrations. Workflow enables the simple automation of processes and tying together actions in ServiceNow.

We'll start with a simple "Hello, world" PubNub REST Activity, then expand it to be triggered from an Incident being created in ServiceNow using Workflow.

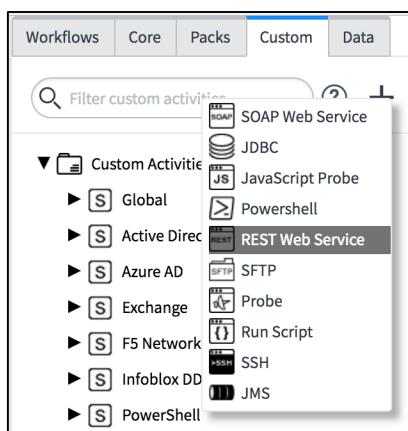

Create Lab 3 starting branch

1. If you completed the lab setup, proceed to the next step.

If you haven't yet completed lab setup, follow the steps in lab setup to create the **my-Lab3-branch** from the **Lab3-start** git tag.

Create a REST Activity for PubNub

1. Open the **Orchestration > Workflow Editor**.
2. From the **Custom** tab, click the '+' icon to create a new **REST Web Service** activity.

This will open the Activity Designer using the REST Web Service template.

Give the activity a name such as "**Send to PubNub Hello World**" and click **Continue**.

3. On the **Inputs** tab, click '+' to define an input variable.

Name	Type	Mandatory	Default
{ } Input			

Define the following input variables:

pub_key (default value: **pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8**)

sub_key (default value: **sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe**)

channel (default value: **CCW3970_{lab instance name}**)

client (default value: **{lab instance name}**)

Name	Type	Mandatory	Default
{ } Input			
ABC pub_key	String	No	pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8
ABC sub_key	String	No	sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe
ABC channel	String	No	CCW3970_instance1234
ABC client	String	No	instance1234

4. On the **Execution Command** tab, select your REST Message and function. Reference the REST Message and HTTP Method created in the previous lab.

NOTE: if the REST Message defined Variable Substitutions, then they will be automatically imported into the REST Activity. But if not, you can click the '+' button to just define them here.

Imported from REST Message

Name	Value	Additional attribute
pub_key		None
sub_key		None
channel		None
client		None

5. Drag & drop the **message** and **channel** input variables to the corresponding Variable substitution field.

Drag to text box

Name	Value	Additional attribute
pub_key		None
sub_key		None
channel		None
client		None

Name	Value	Additional attribute
pub_key	\${activity\$input.pub_key}	None
sub_key	\${activity\$input.sub_key}	None
channel	\${activity\$input.channel}	None
client	\${activity\$input.client}	None

Then click **Continue**.

6. On the **Outputs** tab, add the HTTP status code as an output variable

The screenshot shows the 'Activity Designer - Send to PubPub' interface. The top navigation bar includes 'Test Inputs', 'Delete', 'Save', 'Publish', and 'Continue'. Below the navigation is a flowchart with nodes: General, Inputs, Execution Command, Outputs, and Conditions. The 'Outputs' node is highlighted with a blue border. On the left, there are two rows: 'Local' (Type Local) and 'Output' (Type Local). On the right, there is a 'Parsing rules' table with columns: Variable name, Description, Source, and Parsing type. A tooltip above the table says 'Drag a variable into the Parsing rules table to create an output field mapping.' A red arrow points to the '+' button next to the 'Output' row.

Name the variable '**status_code**'

The screenshot shows the same 'Activity Designer - Send to PubPub' interface. The 'Outputs' tab is active. The 'Output' row now contains 'ABC status_code' in the 'Name' field, 'String' in the 'Type' field, and a red minus sign in the 'Delete' field. A red arrow points to the 'status_code' entry in the 'ABC status_code' input field.

7. Drag the **status_code** variable to the parsing rules field

The screenshot shows the same interface. The 'Outputs' tab is active. The 'Output' row now contains 'ABC status_code' in the 'Name' field, 'String' in the 'Type' field, and a red minus sign in the 'Delete' field. A red arrow points from the 'status_code' entry in the 'ABC status_code' input field to the 'drag' placeholder in the 'Source' column of the 'Parsing rules' table.

8. In the **Parsing rule** popup:

Parsing source: executionResult.status_code

Parsing Type: Direct

Parsing rule for status_code

Parsing source: executionResult.status_code

Variable Name: activityOutput.status_code

Parsing Type: Direct

Short Description:

ABC status_code String -

then → Submit

Go to Post-Processing Continue

9. Now click **Continue** on the Outputs tab

Activity Designer - Send to PubNub

General → Inputs → Execution Command → Outputs → Conditions

Name Type

{ } Local

{ } Output

ABC status_code String -

Drag a variable into the Parsing rules table to create an output field mapping.

Parsing rules

Variable name	Description	Source	Parsing type
activityOutput.status_code	executionResult.status_code	executin	Direct

then → Continue

Go to Post-Processing Continue

10. On the **Conditions** tab, add the following two conditions, then click **Save**.

Name: Success

Condition: activityOutput.status_code == 200

Else: false

Order: 100

Name: Failure

Condition: (empty)

Else: true

Order: 200

The screenshot shows the 'Conditions' tab of a REST Activity in ServiceNow. The 'Condition defaults' section lists two rows:

Name	Condition	Else	Order
Success	activityOutput.status_code == 200	false	100
Failure		true	200

A red box highlights the 'Success' row. A large red arrow points to the 'Save' button at the bottom right of the screen.

11. Note that your new REST Activity is defined as a Custom activity in the right-hand pane.

The screenshot shows the 'Custom' tab of the Activities list in ServiceNow. The 'Custom Activities' section lists several activities, with one specifically highlighted:

- Global
- Active Directory
- Azure AD
- Exchange
- FS Network Management
- Infoblox DDI
- PowerShell
- Probe
- System Center Configuration Manager (SCCM)
- SFTP File Transfer
- SSH
- Workday Orchestration
- ccw3970_demo_app** (highlighted with a red box)
- Publish message to PubNub - v1 Checked out

A red box highlights the 'ccw3970_demo_app' entry. A large red arrow points to the 'Save' button at the bottom right of the screen.

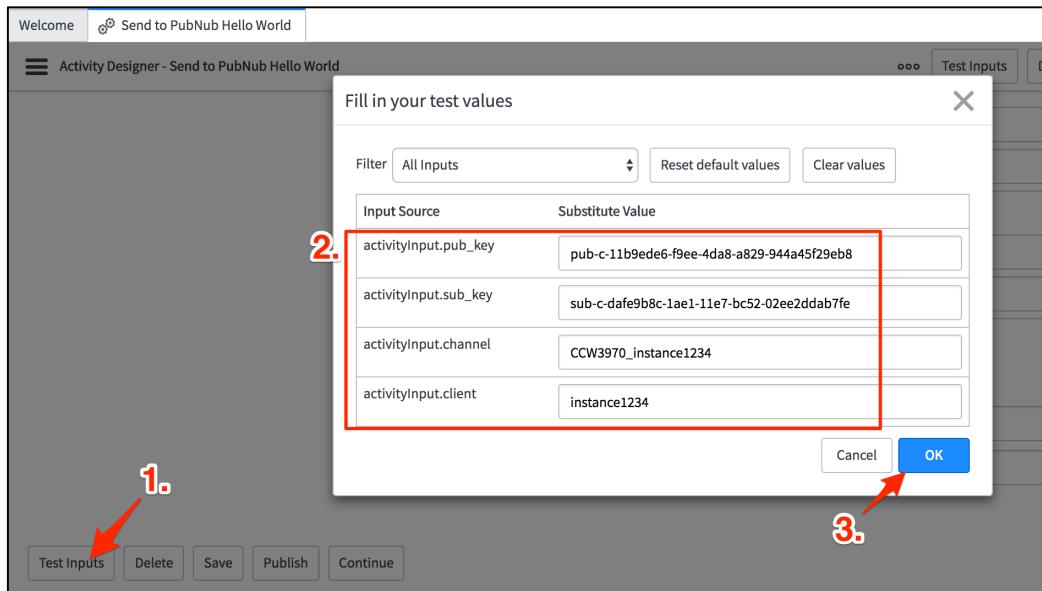

Test the REST Activity

1. To view the message that was received by PubNub. In your browser navigate to <https://ccw3970-demo.glitch.me/> and enter values for the channel name you plan to use and click Subscribe. Now send the test.

This should be the default value, **CCW3970_<lab instance name>**, but can be specified ad-hoc.

2. Click **Test Inputs**. On the popup, enter values for the input fields. These should already be populated from default values from the Activity, but if not, enter as below.

activityInput.pub_key: pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8
activityInput.sub_key: sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe
activityInput.channel: CCW3970_instance1234
activityInput.client: instance1234

- On the Response page, verify the status code is **200** and that the message was sent.

```

{
  "status_code": 200,
  "header": {
    "Cache-Control": "no-cache",
    "Access-Control-Allow-Origin": "*",
    "Access-Control-Allow-Methods": "GET",
    "Connection": "keep-alive",
    "Content-Length": "30",
    "Date": "Tue, 18 Apr 2017 04:50:36 GMT",
    "Content-Type": "text/javascript; charset=\"UTF-8\""
  },
  "body": "[1,\"Sent\"],[14924910364873248]",
  "error": null
}

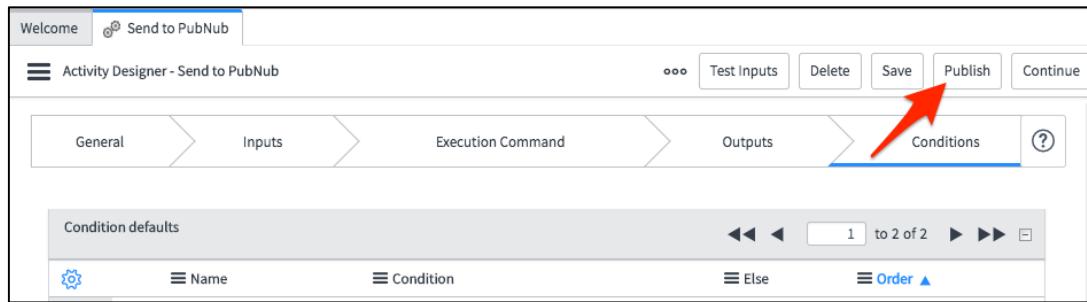

```

- Navigate to **System Logs > Outbound HTTP Requests** again to view the most recent HTTP request. Verify the request is listed.
- Verify the message was received for the channel at <https://ccw3970-demo.glitch.me/>.

NOTE: You need to subscribe to the channel you are publishing to **BEFORE** the message is sent in order to see it in the PubNub Channel Log app.

- You can repeat the test steps above as many times as you'd like.

- When the REST Activity is behaving as expected, **Publish** the Activity.

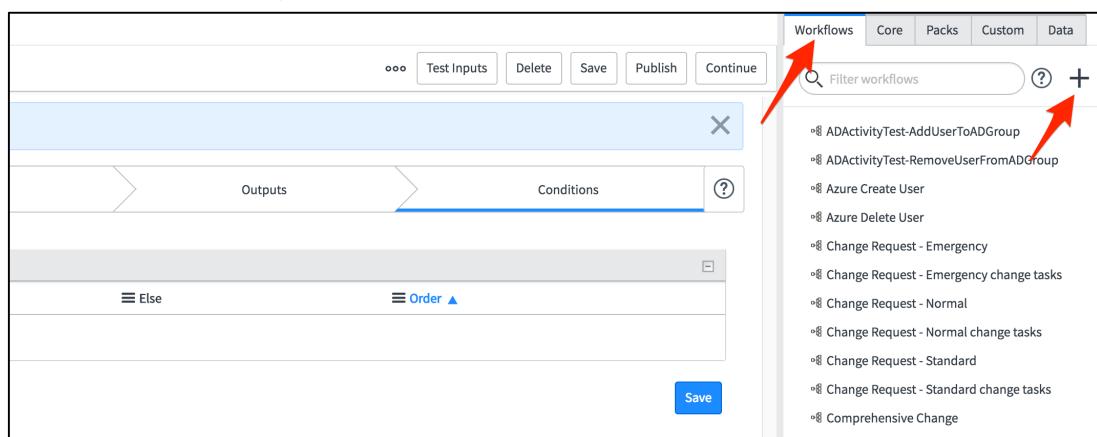

Mid-way Catch Up

- This is the midpoint of lab 4. If you had problems with this lab up to this point and want to fast forward to catch up to review the completed updates you can follow the same process, you followed in **Lab Setup** to create a branch from the **Lab3-mid tag**. This will update your application to a state that you would be if you successfully completed Lab 3 up to the current midpoint.
- In Studio, navigate to **Source Control > Create Branch**.
- In the pop-up window, enter a branch name, then select **Lab3-mid** from the **Create from Tag** menu, and click **Create Branch**.

Branch: **my-Lab3-mid-branch**
Create from Tag: **Lab3-mid**

Use the Hello World REST Activity in a Workflow

- Click the **Workflow** tab, then click the '+' icon to create a new Workflow.

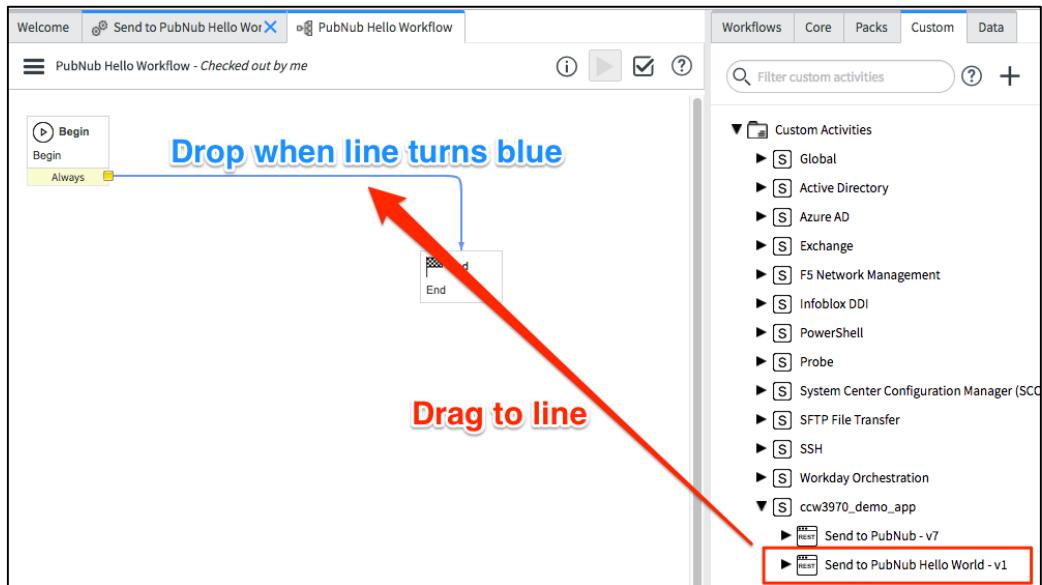

- On the New Workflow page, give the Workflow a Name and configure as follows, then click **Submit**.

Table: Incident

Condition: Active is true

The screenshot shows the 'New Workflow' dialog box. In the 'Conditions' section, there is a condition set up with the following criteria: 'If condition matches' is set to 'Run the workflow', 'Condition' is set to 'Add Filter Condition', and the filter condition is 'Active is true'. Both the 'Table' dropdown and the filter condition are highlighted with red boxes. A red arrow points to the 'Submit' button at the top right of the dialog.

3. From the **Custom** tab, Drag and drop the PubNub REST Activity to the Workflow. Drop it on the Workflow when the line turns blue.

4. Give the Workflow Activity a name, and enter the Activity inputs as before.

Name: PubNub Hello Activity

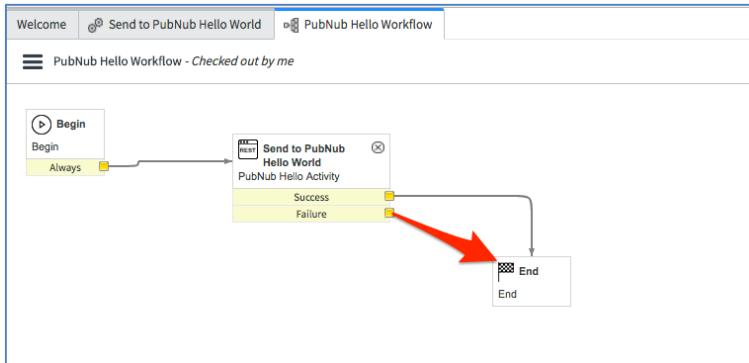

Pub Key: pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8

Sub Key: sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe

Channel: CCW3970_instance1234

Client: instance1234

5. Drag a line to connect from the Failure condition to the End state.

NOTE:

In a real application, handling failure is critical. You can imagine how receiving an HTTP 400 error response might result in the failure being logged somewhere, and the call NOT being retried since that is an unrecoverable condition.

What should be the behavior if an HTTP 500 error is received? Hint: retry. Limit the number of retries, and consider an exponential back-off (wait) period between retries. You can implement this retry logic in the workflow logic.

Test the Workflow

1. Get ready to view the message was received by PubNub. In your browser navigate to <https://ccw3970-demo.glitch.me/> and enter values for the channel name you plan to use to send the test.

This should be the default value, **CCW3970_<lab instance name>**, but can be specified ad-hoc.

2. Create a new **Incident** record.
3. Navigate to **System Logs > Outbound HTTP Requests** again to view the most recent HTTP request. Verify the request is listed.
4. Verify the message was received for the channel at <https://ccw3970-demo.glitch.me/>.

NOTE: You need to subscribe to be subscribed to the channel BEFORE the message is sent in

order to receive it in the glitch app.

5. You can repeat the test steps above as many times as you'd like.

Update the REST Activity to pull data from the Incident record

1. To save time, we've pre-built a REST Activity. Now we need to modify it to include an additional field **caller_id** in the payload message.

In **Studio**, Open the PubNub **REST Message**. We're going to make further use of REST Message template variables e.g. \${sys_created_on}.

Open the **HTTP Method** "Publish Message", and select the **HTTP Request** tab. Note the **Content** field still contains the message payload from before.

```
{"message": "Hello PubNub from ServiceNow CCW3970 Lab Instance"}
```

2. Replace the **Content** field with this payload. Note that it contains template variables.

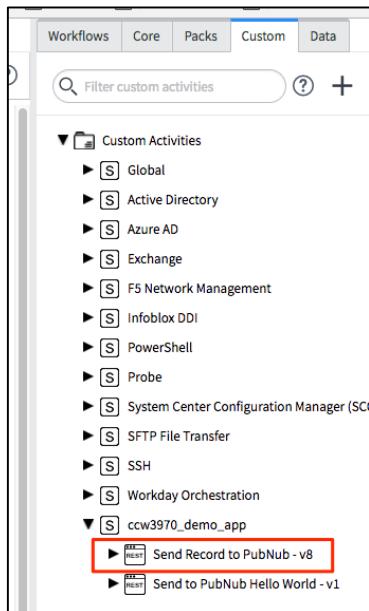

The screenshot shows the ServiceNow Studio interface with the REST Message activity open. The HTTP Request tab is selected. In the Content section, a JSON payload is displayed:

```
{  
    "active": "${int_active}",  
    "assigned_to": "${int_assigned_to}",  
    "caller_id": "${int_caller_id}",  
    "category": "${int_category}",  
    "created_on": "${int_sys_created_on}",  
    "number": "${int_number}",  
    "priority": "${int_priority}",  
    "state": "${int_state}",  
    "sys_id": "${int_sys_id}",  
    "updated_by": "${int_sys_updated_by}",  
    "updated_on": "${int_sys_updated_on}"  
}
```

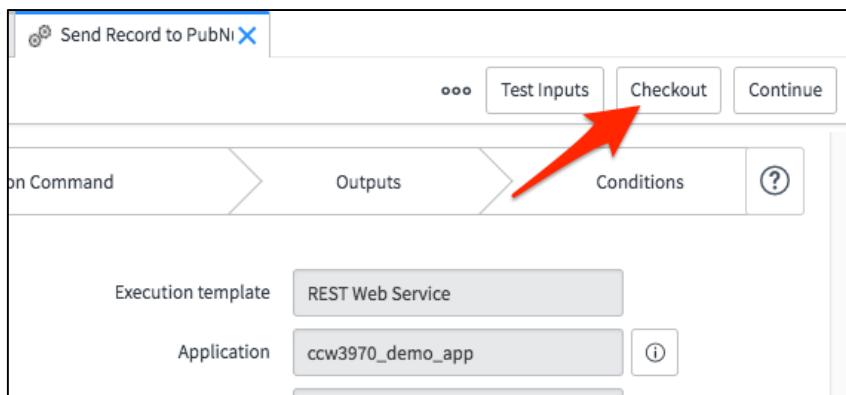

Note the payload can be copy/pasted from the GitHub snippets repo (file [ccw3970_restmessage_content_body.json](#)) or directly from:

https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-Outbound-REST-Snippets/master/ccw3970_restmessage_content_body.json

3. From REST Message, click **Test** to test the new payload is sent correctly to PubNub. Verify channel settings are correct in the “Test Value” field.
4. Go back to the **Orchestration > Workflow Editor**. Open the **Send Record to PubNub Activity**.

5. Click **Checkout** to edit the Activity.

6. On the **Inputs** tab, we need to add a new input field to the *curr_record* Object. Expand the *curr_record* Object.

Name	Type	Mandatory	Default
{ } Input			
ABC pub_key	String	No	pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8
ABC sub_key	String	No	sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe
ABC channel	String	No	channel-instance1234
ABC client	String	No	client-instance1234
► { } curr_record	Object		

7. Note that **caller_id** is not currently defined. Click the '+' icon to add a new field to the Object definition.

Welcome ➔ Send to PubPub Hello World ➔ PubPub Hello Workflow ➔ Send Record to PubPub *

Activity Designer - Send Record to PubPub

General Inputs Execution Command Outputs Conditions

Name	Type	Mandatory	Default	
{ } Input				+ (blue)
ABC pub_key	String	No	pub-c-11b9ede6-f9ee-4da8-a829-944a45f29eb8	- (red)
ABC sub_key	String	No	sub-c-dafe9b8c-1ae1-11e7-bc52-02ee2ddab7fe	- (red)
ABC channel	String	No	channel-instance1234	- (red)
ABC client	String	No	client-instance1234	- (red)
▼ { } curr_record	Object			+ (blue)
T/F active	Boolean	No		- (red)
ABC assigned_to	String	No		- (red)
ABC category	String	No		- (red)
ABC created_on	String	No		- (red)
ABC number	String	No		- (red)
ABC priority	String	No		- (red)
ABC state	String	No		- (red)
ABC sys_id	String	No		- (red)
ABC updated_by	String	No		- (red)
ABC updated_on	String	No		- (red)

Go to Pre-Processing Continue

8. Give the field the name “**caller_id**” and press **Enter** key, then click **Continue**.

ABC sys_id	String	No	⊖
ABC updated_by	String	No	⊖
ABC updated_on	String	No	⊖
ABC caller_id	String	No	⊖

Go to Pre-Processing **Continue**

9. On the **Execution Command** tab, click ‘+’ to add a new **Variable substitution**. The variable name is “int_caller_id” defined on the REST message, so it needs to match here.

Then drag the new **caller_id** input to the variable value. Here is the finished state.

ABC caller_id	int_sys_created_on	\$[activity/input.curr_...	None	⊖
	int_number	\$[activity/input.curr_...	None	⊖
	int_priority	\$[activity/input.curr_...	None	⊖
	int_state	\$[activity/input.curr_...	None	⊖
	int_sys_id	\$[activity/input.curr_...	None	⊖
	int_sys_updated_by	\$[activity/input.curr_...	None	⊖
	int_sys_updated_on	\$[activity/input.curr_...	None	⊖
	int_active	\$[activity/input.curr_...	None	⊖
	int_caller_id	\$[activity/input.curr_...	None	⊖

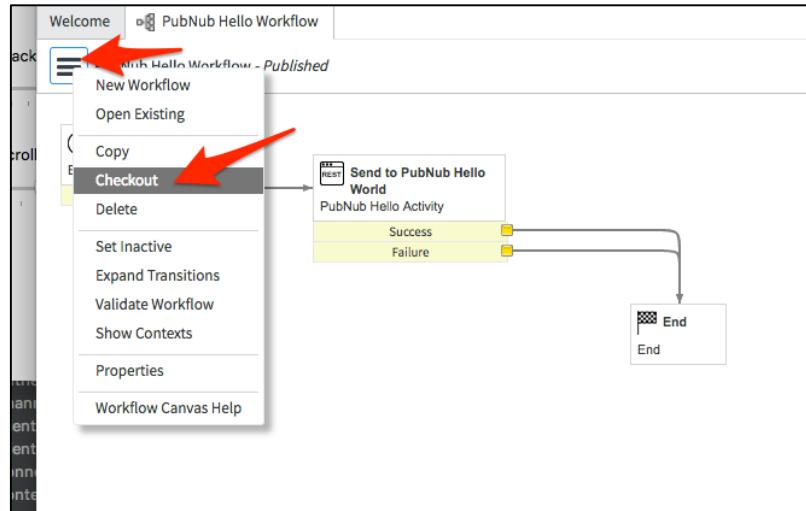

10. **Save and Publish** the REST Activity.

Use the new REST Activity in a Workflow

1. Open the PubNub Workflow previously created. You can find it in the **Workflow navigation tab** by typing “PubNub”.

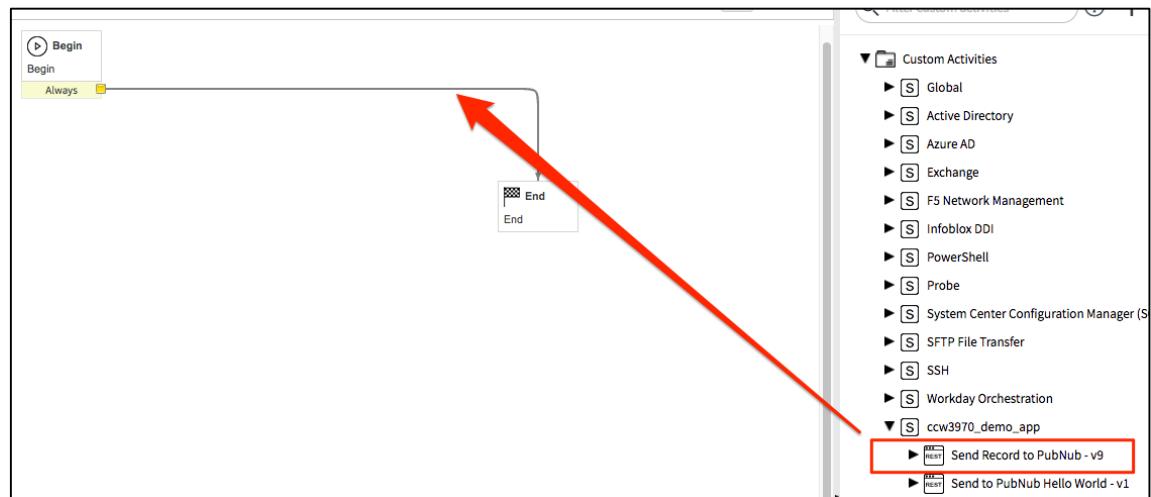

Workflows	Core	Packs	Custom	Data
<input type="text" value="PubNub"/> ? +				
PubNub Hello Workflow				

2. If necessary, **Checkout** the Workflow. (It may already be checked out from before)

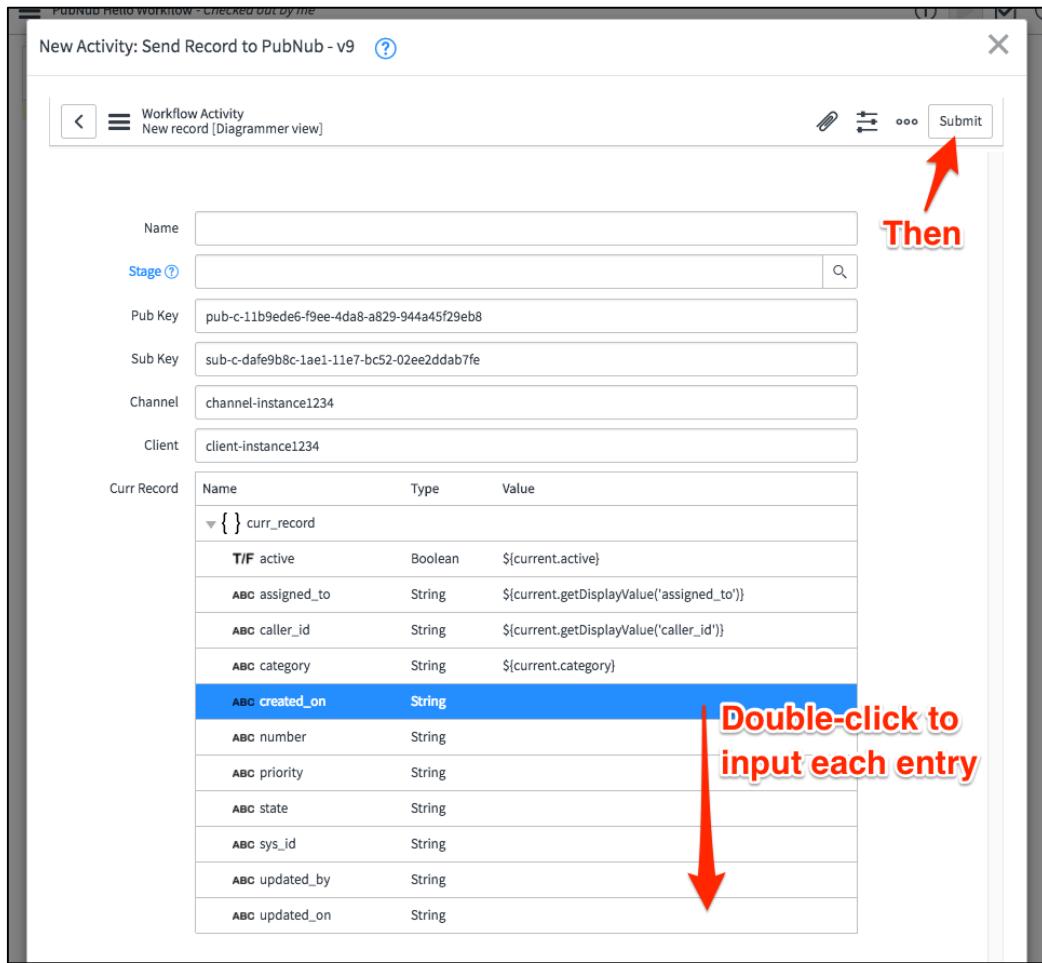

3. Hover and click the X icon to **delete** the Hello World Activity from the Workflow.

4. From the **Custom** tab, Drag the **Send Record to PubNub** Activity to the Workflow.

5. Now you need to reference the values from the **current record** (the Incident that was created), to bind them to the **Input variables** from the **REST Activity**.

Note the needed values can be copy/pasted one-by-one from the GitHub snippets repo (file [ccw3970_rest_activity_current_inputs.txt](#)) repo or directly from:
[https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-
Outbound-REST-Snippets/master/ccw3970_rest_activity_current_inputs.txt](https://raw.githubusercontent.com/CreatorCon17/CCW3970-Build-Debug-Outbound-REST-Snippets/master/ccw3970_rest_activity_current_inputs.txt)
 Then click **Submit**.

6. Test the Workflow again by creating a **new Incident** record. Be sure to fill out the various fields such as **Caller**, **Assigned To**, etc in order to see the values for those fields be extracted and sent to PubPub.

Verify the message are received on your PubPub channel and that they're fully populated with data from the Incident record.

Remember, you can view the **HTTP Outbound Request Log** to see what was sent from ServiceNow.

Catch Up

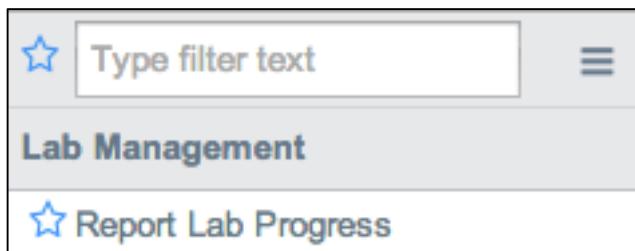

1. If you had problems with this lab and want to fast forward to the end of lab 3 to review the completed updates you can follow the same process, you followed in **Lab Setup** to create a branch from the **Lab3-end tag**. This will update your application to a state that you would be if you successfully completed Lab3.
2. In Studio, navigate to **Source Control > Create Branch**.
3. In the pop-up window, enter a branch name, then select **Lab3-end** from the **Create from Tag** menu, and click **Create Branch**.

Branch: **my-Lab3-end-branch**

Create from Tag: **Lab3-end**

Progress Report

1. Navigate to **Lab Management> Report Lab Progress**.

2. Click **I am done!**

Let instructor know how you are doing on the lab(s) by selecting the appropriate button.

**--Intentionally
Left Blank—**
